One block North of Steels

ELECTRONYSTAGMOGRAPHY (ENG / VNG)

EXPLANATION

An ENG / VNG test in which Video goggle will be applied to identify diseases or disorders causing vertigo, dizziness or inner ear disorders. Electrodes Goggles will be taped to your skin around your eyes to measure nystagmus - an involuntary, repetitive movement of the eyeball. Several recordings of eye motion will be made while you move your head in different positions. The tests will be performed while small quantities of warm and cold water are placed in your ear canals. The ENG / VNG test takes approximately 30 - 60 minutes.

INSTRUCTIONS

Please do not eat for three hours before the ENG test. **IF YOU ARE DIABETIC, DO NOT SKIP ANY MEALS.** Refrain from taking sedatives, tranquilizers, antihistamines, drugs for nausea or dizziness and alcoholic beverages for 24 hours prior to your appointment. If you are on any medications for heart, blood pressure, thyroid, cholesterol, diabetes or epilepsy, continue these as usual. **Please refrain from applying moisturizer and foundation makeup to your face before your test.** Due to the fact that some patients may experience prolonged dizziness after the test is complete, it is recommended that you have someone drive you home after the test if possible. Please check in at least 10 minutes early unless your appointment is for 8:00 am or 1:00 pm.
